

**SYSTEM AND METHOD FOR SELECTIVELY TRANSFERRING WIRELESS
CALLER LOCATION INFORMATION**

ABSTRACT:

[0022] A system and method for providing for a wireless calling party to configure his or her wireless service on a call-by-call or on a permanent basis so that only those calls where the caller wants his or her location to be available carry location information. To enable the capability of blocking and/or **altering** location, the caller can pre-configure his or her service so that the location information of the wireless calling party is **either altered or** blocked to the called party on a permanent basis. The wireless caller can also select on a call-by-call basis to **either alter or** block the location information to the called party by entering a particular code prior to making a call. Furthermore, a wireless caller may also select to block the storage of location information in the network by entering a pre-defined number prior to making a call, which in turn can then be used to place the outgoing call.
